

CLEANVERSE BUILD · TRUSTED ASSETS · DEFI

Kudira

Buy now, pay later underwritten by verified identity instead of collateral.
The merchant is paid in full at checkout while Kudira carries the credit risk.

116 tests green

THE PROBLEM

Uncollateralised credit against an anonymous wallet cannot work.

01

A limit inferred from wallet history is a limit anyone can manufacture.

02

One person opens unlimited wallets and draws unlimited credit from each.

03

Default costs the borrower nothing but a discarded keypair.

04

The only safe design left is collateral. A loan secured by collateral is a pawnshop, not BNPL.

WHY CLEANVERSE IS LOAD-BEARING

The honest test of an integration is what happens when you remove it.

A-Pass is bank-verified, wallet-bound, non-transferable and revocable. That is what lets a credential carry the risk collateral otherwise has to.

Remove Cleanverse from Kudira and you do not get a degraded product. **You get nothing.**

HOW IT WORKS

Five stages, one purchase.

VERIFY

Read the buyer's A-Pass. Standing only, never documents.

UNDERWRITE

subTier sets the credit grade and limit, on-chain.

SETTLE

Merchant paid in full, in the same transaction.

REPAY

Auto-debit pulls each installment as it falls due.

ENFORCE

On-time raises the grade, default lowers it.

The merchant carries no credit risk and waits for nothing. Kudira holds the risk, priced against a credential a borrower cannot fake or discard.

PROOF, NOT PROJECTION

Every claim here is on-chain.

THE VERIFIED RUN

revert originate at subTier 5 fails BorrowerDelinquent

130.00 merchant paid in full, same tx as origination

4× collect, grade 50 → 55 → 60 → 65 → 70

700.00 limit, wasEverLate=false

originate 0x1aeb97fe...0504e3f6

Four Cleanverse modules, each load-bearing.

A-PASS READ · UNDERWRITE

`query_apass` gives tier, subTier, status and expiry. No plan may outlive the credential, enforced in the contract.

A-PASS WRITE · GRADE

Repayment writes back through `generate_apass`. On-time +5, default -20, both saturating.

VALIDATOR COMPLIANCE POOL

Registered via `validator/register`. Live and discriminating: `validator/verify` returns **true** for a credentialed wallet, **false** for one generated a second ago.

A-TOKEN SETTLEMENT

Both parties must hold a credential, enforced on-chain. We settle in KUSDC, an A-Token we issued under our Issue Member scope after Cleanverse's Base faucet stopped dispensing aUSDC on 24 July. Same `min_tier 5` rule, gated identically. We can mint KUSDC but cannot mint past a credential check.

Four things a live sandbox taught us that no local test could.

THE ONE-SECOND WINDOW

Auto-debit could never earn its reward. A payment was on time only at the exact due second, which a chain cannot hit. The tests were green against a moment that cannot happen. Fixed with a grace period, stored per plan.

THE INVISIBLE AUSDC GATE

Nothing in the token's ABI shows it gates transfers. The check lives in `_update` behind namespaced storage, reverting `NoAPass` before the balance check. Reading the interface gives a confident, wrong answer.

THE TLS HANDSHAKE

Node 24's default post-quantum key share is silently dropped by the Cleanverse edge. Every request from Node timed out while curl succeeded. Restricting to classical curves fixes it and still negotiates TLS 1.3.

THE TRAVEL RULE BOUNDARY

TR_001 for our tx, CV_100 for another institution's wallet. That contrast isolates the cause to indexing: our A-Token sits outside the settlement flow Travel Rule reports from.

Southeast Asia and Latin America, where the ramp already reaches.

Philippines

Brazil

Mexico

Peru

Malaysia

WHY THESE MARKETS

All five are in Cleanverse's supported ramp country list. We frame demand where the on/off-ramp actually functions, not where a slide says it might.

WHY IT FITS THE DEMO

The storefront is Manila Coffee Roasters, a Philippine merchant paid in KUSDC. The pitch and the product are set in the same place.

Compliance-native BNPL, live and on-chain today.

REPOSITORY

Contracts, frontend, and every sandbox probe.

LIVE DEPLOYMENT

Base Sepolia. Pool registered, run verified.

THE ASK

Judge the depth of integration. Remove A-Pass and there is no product.
